# **Preventing Heatstroke**

### Avoid the heat!

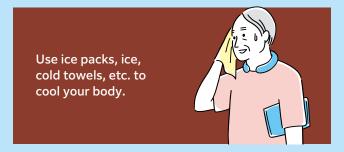

When a "Heatstroke Alert" has been issued, avoid going outdoors whenever possible and avoid the heat.

## Stay hydrated!

When indoors or outdoors, regularly take fluids even when you do not feel thirsty.

What is heatstroke?

"Heatstroke" refers to a condition in which body heat is trapped in the body due to poor body temperature regulation by sweating in a hot and humid environment. It can occur not only when you are outdoors, but also when staying indoors not doing any exercise or work. Heatstroke sufferers may be taken to hospital by ambulance and in some cases die from it. In order to prevent health problems caused by heatstroke, each individual should have a correct understanding of heatstroke, be aware of changes in their physical condition, and look out for those around them.

## **Heatstroke symptoms**

- Dizziness
- Giddiness
- Slight yawning
- Profuse sweating
- Muscle aches
- Muscle cramp

• Headache

Vomiting

- Lethargy
- Impaired judgment
- Loss of
- concentration
- Despondency

If the symptoms do not improve after first aid, please go to a medical institution.

When the

symptoms

progress...

### If you come across people suspected of heatstroke (Main first aid)

Take them to a cool place such as an air-conditioned room or shady spot with good ventilation.

## Loosen their clothes and cool their body.

(Around the neck, under the armpits, groin, etc.)

## Take oral rehydration solution\*

\* Drinking a large amount of oral rehydration solution at once may lead to an excessive sodium intake.

If you are being treated for a kidney, heart or other diseases and your doctor has instructed you about intake of fluid, please follow their instructions.

If they are unable to drink by themselves, or if their response is not normal, call an ambulance right away!

#### People feel heat in different ways.

The way people feel heat depends on their physical condition on that day, whether they are used to heat, and other factors. Be mindful of changes in your physical condition.

#### Also prevent heatstroke indoors!

Even if you do not feel hot, check the room temperature and ambient temperature, and try to adjust the temperature using electric fans and air conditioners.

### Elderly people, children, and those with disabilities need to be especially kept an eye on!

Caution is necessary since elderly people are less able to sense the heat and a lack of fluids, and their body's ability to regulate heat is impaired. Also, children need to be kept an eye on since their body temperature adjustment functions are not fully developed yet. In addition, for those with disabilities, it may be difficult to regulate their body temperature, they may not notice when they are thirsty, or they may not be able to take fluids by themselves so caregivers and people around them should be keep an eye on them.
